Appendix I

Pacific Coast Groundfish Fishery Management Plan

Appendix B.3 EFH Text Descriptions (Habitat Use Database Output of Species/Life Stage Distribution/Associations)

Utility of the Habitat Use Database

The Pacific Habitat Use Relational Database (HUD) has been developed to provide a flexible, logical structure within which information on the uses of habitats by species and life stages in the west coast groundfish species complex can be stored, summarized and analyzed as necessary. This database was an important component of the information base for developing the Habitat Suitability Probability (HSP) analysis used in development of the Essential Fish Habitat EIS. The HUD tables provide a detailed text description of groundfish EFH pursuant to guidelines at 50 CFR 600.815(a).

The database is designed primarily to capture the important pieces of information from a complete literature review on habitat use by species in the Pacific Groundfish FMP. The database, drawing from a complete literature review, allows habitat type determinations to be made in terms of the literature. The database is constantly being updated with new information due to the dynamic nature of current scientific understanding. The legal text description of the geographic extent of EFH has been determined through an FMP amendment. Therefore the legal EFH text description will remain constant, requiring the FMP to be further amended to incorporate new information in the database that may redefine EFH.

Habitat use data can be analyzed both by species and habitat to provide input into various components of the analysis of EFH, HAPCs and fishing impacts. For example, information on habitat type gathered from a survey site can be used to determine what groundfish species and lifestages exist there, as well as associated activities and prey. Similarly, species information can be used to determine what habitat types provide waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity. The fundamental variables for determining if a particular area is EFH for a particular species are latitude, substrate and depth, which overlap with areas of observed prey species. HUD outputs, HSP maps and the final preferred alternative for identification of EFH, provide the components necessary for determining areas to be considered for management under EFH regulations at 50 CFR 600.815.

EFH Text Descriptions

Text descriptions are provided for species life stage (adult, juvenile, larval, and egg) in terms of the following variables: depth range, latitude range, habitat associations by activity (breeding, feeding, and growth to maturity), and prey. Depth (in meters) and latitude (in decimal degrees) are presented as ranges from the absolute minimum to the absolute maximum. The habitat types each species/life stage associates with, depending on the activity, and prey species are presented as lists. The fundamental variables for determining if a particular area is EFH for a particular species are latitude, substrate and depth, which overlap with areas of observed prey species.

The text descriptions were generated from the HUD (described in the Risk Assessment) and are to be read as follows: First, a shaded header row lists each groundfish species' common name, genus and species. Immediately below this header is the lifestage; i.e. adult, juvenile, etc. The minimum/maximum depth (meters) and minimum/maximum latitude (decimal degrees north) are listed for each lifestage. For each species, there are preferred habitat combinations listed with associated activities and observed prey. Most species/lifestages are observed within multiple habitat combinations and therefore many species/lifestages will have multiple habitat combinations listed below them. The habitat preferences are broken down by four life stages: eggs, larvae, juveniles and adults. The HUD contains absolute depth as well as latitude values for the four life stages of most species in the FMP. All depths listed are in meters. All latitudes are in decimal degrees north.

EFH is limited to US waters. In the instances where the text description includes a latitude range that extends beyond US waters, EFH stops at the boundary.

Preferred habitat types are classified according to their physical features. The habitat classifications are currently independent and are not structured as sub sets within one another. For the west coast, the following types have been delineated (as described in the Risk Assessment):

Megahabitat:

Abyssal Plain	Inland Sea	Shelf
Coastal Intertidal	Island Shelf	Slope/Rise
Estuarine	Nearshore	Slope/Rise/Plain

Induration:

Basin	Seamount	Water Column
Benthos	Submarine Canyon	
Intertidal Benthos	Unknown	

Meso/macro habitat:

Artificial Structure	Epipelagic Zone	Mesopelagic Zone
Biogenic	Hard Bottom	Mixed Bottom

Tide Pool	Unconsolidated	Unknown
Vegetated Bottom		

Modifier:

Algal Beds/Macro	Gravel/Rock	Sand/Rock
Artificial Reef	Macrophyte Canopy	Sea anemones
Basketstars	Mixed mud/sand	Sea Lilies
Bedrock	Mud	Sea Urchins
Boulder	Mud/Boulders	Sea Whips
Brittlestars	Mud/Cobble	Seawater surface
Clay	Mud/Gravel	Silt
Cobble	Mud/Rock	Silt/Sand
Current System	Oil/Gas Platform	Soft Bottom/Boulder
Demosponges	Piers	Soft Bottom/Rock
Drift Algae	Rooted Vascular	Sponges
Fronts	Sand	Tube Worms
Gooseneck barnacles	Sand/Boulders	Unknown
Gravel	Sand/Cobble	Vase Sponges
Gravel/Cobble	Sand/Gravel	

Each combination of these four levels defines a unique habitat type. The observed activity and prey are reported for each of these unique combinations of preferred habitat type.

EFH is defined by the Magnuson-Stevens Act as those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity (16 U.S.C. 1802(10)). Therefore the terms spawning, feeding and growth to maturity are used to describe observed activities. In some habitats, all of these activities are observed. Other habitats have unknown activities associated with them.

Prey observed within the habitat type are listed as specifically as possible. Attempts are made to list as a taxonomic group, ranging from Family name, to genus and species. Occasionally only a descriptive name is available.

There are instances where no data is available from the literature. Blanks in the table represent these data gaps.
